# **PDL: Syntax**

#### Formulae:

F, G, H	::=	$\perp$	(falsum)
		Т	(verum)
		p	$p\in \Pi_0$ (atomic formula)
		$\neg F$	(negation)
		$(F \land G)$	(conjunction)
		$(F \lor G)$	(disjunction)
		$(F \rightarrow G)$	(implication)
		$(F \leftrightarrow G)$	(equivalence)
		$[\alpha]F$	$if\; \alpha \in Prog$
		$\left< lpha \right> {\it F}$	$if\; \alpha \in Prog$

#### **Programs:**

$lpha$ , $eta$ , $\gamma$	::=	$lpha_{0}$	$\alpha_{0} \in Prog_{0}$ (atomic program)
		F?	F formula (test)
		lpha; $eta$	(sequential composition)
		$\alpha \cup \beta$	(non-deterministic choice)
		$lpha^*$	(non-deterministic repetition)

A PDL structure  $\mathcal{K} = (S, R(), I)$  is a multimodal Kripke structure with an accessibility relation for each atomic program. That is it consists of:

- a non-empty set S of states
- an interpretation R():  $\operatorname{Prog}_0 \to \mathcal{P}(S \times S)$  of atomic programs that assigns a transition relation  $R(\alpha) \subseteq S \times S$  to each atomic program  $\alpha$
- an interpretation  $I : \Pi \times S \rightarrow \{0, 1\}$

The interpretation of PDL relative to a PDL structure  $\mathcal{K} = (S, R(), I)$  is defined by extending R() to Prog and extensing I to  $\operatorname{Fma}_{\operatorname{Prop}_0}^{PDL}$  by the following simultaneously inductive definition:

### **Interpretation of formulae/programs**

$val_\mathcal{K}(p,s)$	=	l(p,s)
$val_\mathcal{K}(\neg F, s)$	=	$\neg_{Bool} val_{\mathcal{K}}(F, s)$
$\mathit{val}_\mathcal{K}(\mathit{F} \wedge \mathit{G}, \mathit{s})$	=	$\mathit{val}_\mathcal{K}(F, s) \wedge_{Bool} \mathit{val}_\mathcal{K}(G, s)$
val $_{\mathcal{K}}(F ee G, s)$	=	$val_{\mathcal{K}}(F, s) ee_{Bool} val_{\mathcal{K}}(G, s)$
val $_{\mathcal{K}}([lpha]{\sf F},{\sf s})=1$	iff	for all $t\in S$ with $(s,t)\in R(lpha)$ , val $_{\mathcal{K}}(F,t)=1$
val $_{\mathcal{K}}(\langle lpha  angle$ F, s $)=1$	iff	for some $t\in S$ with $(s,t)\in R(lpha)$ , $\mathit{val}_\mathcal{K}(F,t)=1$
R([F?])	=	$\{(s,s)\mid \mathit{val}_\mathcal{K}(F,s)=1\}$
		( $F$ ? has the same meaning as: if $F$ then skip else do not terminate)
${\sf R}(lpha\cupeta)$	=	${\sf R}(lpha)\cup{\sf R}(eta)$
R(lpha;eta)	=	$\{(s,t) \mid \text{ there exists } u \in S \ s.t.(s,u) \in R(\alpha) \text{ and } (u,t) \in R(\beta)\}$
$R(lpha^*)$	=	$\{(s,t) \mid \text{ there exists } n \geq 0 \text{ and there exist } u_0,\ldots,u_n \in S \text{ with }$
		$s = u_0, y = u_n, (u_0, u_1), \ldots, (u_{n-1}, u_n) \in R(\alpha)$

### Interpretation of formulae/programs

- $(\mathcal{K}, s)$  satisfies F (notation  $(\mathcal{K}, s) \models F$ ) iff  $val_{\mathcal{K}}(F, s) = 1$ .
- F is valid in  $\mathcal{K}$  (notation  $\mathcal{K} \models F$ ) iff  $(\mathcal{K}, s) \models F$  for all  $s \in S$ .
- *F* is valid (notation  $\models$  *F*) iff  $\mathcal{K} \models$  *F* for all PDL-structures  $\mathcal{K}$ .

# Axiom system for PDL

#### Axioms

(D1)	All propositional logic tautologies
------	-------------------------------------

- (D2)  $[\alpha](A \to B) \to ([\alpha]A \to [\alpha]B)$
- $(D3) \qquad [\alpha](A \land B) \leftrightarrow [\alpha]A \land [\alpha]B$
- (D4)  $[\alpha;\beta]A \leftrightarrow [\alpha][\beta]A$
- $(D5) \qquad [\alpha \cup \beta]A \leftrightarrow [\alpha]A \wedge [\beta]A$
- $(D6) \qquad [A?]B \leftrightarrow (A \rightarrow B)$
- $(D7) \qquad [\alpha^*]A \leftrightarrow A \wedge [\alpha][\alpha^*]A,$

(D8) 
$$[\alpha^*](A \to [\alpha]A) \to (A \to [\alpha^*]A]$$

#### Inference rules

 $MP \qquad \frac{P, \quad P \to Q}{Q}$   $Gen \qquad \frac{F}{[\alpha]F}$ 

We will show that PDL is determined by PDL structures, and has the finite model property.

### **Soundness and Completeness of PDL**

Proof similar to the proof in the case of the modal system K (with small differences)

**Theorem.** If the formula F is provable in the inference system for PDL then F is valid in all PDL structures.

**Proof**: The axioms are valid in every PDL structure. Easy computation (examples on the blackboard).

The inference rules *MP* and *Gen* preserve validity.

(proof as for the modal logic K)

**Theorem.** If the formula F is is valid in all PDL structures then F is provable in the inference system for PDL.

Proof

Idea:

Assume that F is not provable in the inference system for PDL.

We show that:

- (1)  $\neg F$  is consistent with the set L of all theorems of PDL
- (2) We can construct a "canonical" PDL structure  $\mathcal{K}_L$  and a state w in this PDL structure such that  $(\mathcal{K}, w) \models \neg F$ .

Contradiction!

### **Consistent sets of formulae**

Let *L* be a set of PDL formulae which:

- (1) contains all propositional tautologies
- (2) contains axiom PDL
- (3) is closed under modus ponens and generalization
- (4) is closed under instantiation

**Definition.** A subset  $F \subseteq L$  is called *L*-inconsistent iff there exist formulae  $A_1, \ldots, A_n \in F$  such that

$$(\neg A_1 \lor \cdots \lor \neg A_n) \in L$$

*F* is called *L*-consistent iff it is not *L*-inconsistent.

**Definition.** A consistent set *F* of PDL formulae is called maximal *L*-consistent if for every formula *A* wither  $A \in F$  or  $\neg A \in F$ .

Let *L* be as before. In what follows we assume that *L* is consistent. **Theorem.** Let *F* be a maximal *L*-consistent set of formulae. Then: (1) For every formula *A*, either  $A \in F$  or  $\neg A \in F$ , but not both. (2)  $A \lor B \in F$  iff  $A \in F$  or  $B \in F$ (3)  $A \land B \in F$  iff  $A \in F$  and  $B \in F$ (4)  $L \subseteq F$ (5) *F* is closed under Modus Ponens

**Theorem.** Every consistent set F of formulae is contained in a maximally consistent set of formulae.

**Proofs:** As for modal logic.

### **Canonical models**

**Goal:** Assume *F* is not a theorem. Construct a PDL structure  $\mathcal{K}$  and a state *w* of  $\mathcal{K}$  such that  $(\mathcal{K}, w) \models \neg F$ .

#### **States:**

State of  $\mathcal{K}$ : maximal consistent set of formulae.

```
Intuition: (\mathcal{K}, W) \models F iff F \in W.
```

#### **Accessibility relation:**

Intuition:  $(\mathcal{K}, W) \models [\alpha]F$  iff for all W',  $((W, W') \in R(\alpha) \rightarrow (\mathcal{K}, W') \models F)$  **Goal:** Assume F is not a PDL theorem. Construct a PDL structure  $\mathcal{K}$  and a state w of  $\mathcal{K}$  such that  $(\mathcal{K}, w) \models \neg F$ .

#### States:

State of  $\mathcal{K}$ : maximal consistent set of formulae.

Intuition:  $(\mathcal{K}, W) \models F$  iff  $F \in W$ .

#### **Accessibility relation:**

Intuition:

 $(\mathcal{K}, W) \models [\alpha]F$  iff for all W',  $((W, W') \in R(\alpha) \rightarrow (\mathcal{K}, W') \models F$  $[\alpha]F \in W$  iff for all W',  $((W, W') \in R(\alpha) \rightarrow F \in W')$ 

```
(W, W') \in R(\alpha) \text{ iff } W' \supseteq \{F \mid [\alpha]F \in W\}
```

**Theorem.**  $\mathcal{K}$  satisfies all PDL structure conditions except  $R(\alpha^*) \subseteq (R(\alpha))^*$ .

Proof: By direct checking.

Example:  $R(\alpha; \beta) \subseteq R(\alpha) \circ R(\beta)$ Assume  $(W, W') \in R(\alpha; \beta)$ . Then  $W' \subseteq \{F \mid [\alpha; \beta]F \in W\}$ .

We want to show that there exists  $W_0$  with  $(W, W_0) \in R(\alpha)$  and  $(W_0, W') \in R(\beta)$ .

It is not difficult to show that  $W_0 = \{B \mid [\alpha]B \in W\} \cup \{\neg[\beta]D \mid D \notin W'\}$  is PDL-consistent. For this, the PDL-theorem  $[\alpha; \beta]A \leftrightarrow [\alpha][\beta]A$  is used.

**Theorem.** Assume F is not a PDL theorem. We can construct a PDL structure  $\mathcal{K}'$  and a state w of  $\mathcal{K}'$  such that  $(\mathcal{K}', w) \models \neg F$ .

**Proof.** To obtain a PDL structure that falsifies F we will collapse  $\mathcal{K}$  by a suitable  $\Gamma$  that contains F. The closure rules for  $\Gamma$  that will be needed are:

- Γ is closed under subformulae;
- $[B?]D \in \Gamma$  implies  $B \in \Gamma$ ;
- $[\alpha; \beta]B \in \Gamma$  implies  $[\alpha][\beta]B \in \Gamma$ ;
- $[\alpha \cup \beta]B \in \Gamma$  implies  $[\alpha]B, [\beta]B \in \Gamma$ ;
- $[\alpha^*]B \in \Gamma$  implies  $[\alpha][\alpha^*]B \in \Gamma$

A set  $\Gamma$  satisfying these conditions will be called closed.

# **Completeness/Decidability of PDL**

**Theorem.** If  $\Gamma$  is the smallest closed set containing a given formula F, then  $\Gamma$  is finite.

**Proof.** The point is to show that closing Subformulae(F) under the above rules produces only finitely many new formulae.

Define a formula to be boxed if it is prefixed by a modal connective, i.e. is of the form  $[\alpha]B$  for some  $\alpha$  and B. Each time we apply a closure rule, new boxed formulae appear on the right side of the rule, and further rules may apply to these new formulae.

But observe that the programs  $\alpha$  indexing prefixes  $[\alpha]$  on the right side are in all cases shorter in length than those indexing the prefix on the left of the rule in question. Hence we will eventually produce only atomic prefixes on the right, and run out of rules to apply.

# **Completeness/Decidability of PDL**

Having determined that  $\Gamma$ , the smallest closed set containing F, is finite, we perform a  $\Gamma$ - filtration of  $\mathcal{K}$ .

### **Completeness/Decidability of PDL**

Reminder (modal logic K):

Fix a model  $\mathcal{K} = (S, R, I)$  and a set  $\Gamma \subseteq Fma_{\Sigma}$  that is closed under subformulae, i.e.  $B \in \Gamma$  implies Subformulae $(B) \subseteq \Gamma$ .

For each  $s \in S$ , define

$$\Gamma_s = \{B \in \Gamma \mid (\mathcal{K}, s) \models B\}$$

and put  $s \sim_{\Gamma} t$  iff  $\Gamma_s = \Gamma_t$ ,

Then  $s \sim_{\Gamma} t$  iff for all  $B \in \Gamma$ ,  $(\mathcal{K}, s) \models B$  iff  $(\mathcal{K}, t) \models B$ .

**Fact:**  $\sim_{\Gamma}$  is an equivalence relation on *S*.

Let  $[s] = \{t \mid s \sim_{\Gamma} t\}$  be the  $\sim_{\Gamma}$ -equivalence class of s.

Let  $S_{\Gamma} := \{ [s] \mid s \in S \}$  be the set of all such equivalence classes.

### **Decidability/Completeness**

**Goal:**  $(\mathcal{K}, s) \models A \mapsto (\mathcal{K}', s') \models A, \mathcal{K}' = (S', R', I').$ 

Step 1:  $S' := S_{\Gamma}$ , where  $\Gamma = \text{Subformulae}(S)$ Step 2:  $I' : (\Pi \cap \Gamma) \times S' \rightarrow \{0, 1\}$  def. by I'(P, [s]) = I(P, s)Step 3: R' def. e.g. by:  $([s], [t]) \in R'$  iff  $\exists s' \in [s], \exists t' \in [t]: (s', t') \in R$ 

Same construction for PDL (only we need to define a relation for each program).

**Theorem:**  $\mathcal{K}'$  is a PDL structure (and a filtration of  $\mathcal{K}$ .

If  $(\mathcal{K}, s) \not\models F$  then  $(\mathcal{K}', [s]) \models \neg F$ .

 $\mapsto$  completeness.

**Lemma.** If  $\Gamma$  is finite, then  $S_{\Gamma}$  is finite and has at most  $2^n$  elements, where *n* is the number of elements of  $\Gamma$ .

 $\mapsto \mathsf{decidability}$ 

# Conclusions

Although PDL appears to be more expressive than modal logic, it is still decidable (it has the finite model propety).

Proof calculi for PDL exist.

For really reasoning about programs, often *first order dynamic logic* is needed (undecidable)

We introduce first-order modal logic and consider its relationship to classical first-order logic.

# **First-order modal logic**

Syntax

Semantics

# **Syntax**

#### **Given:**

A signature  $\Sigma = (\Omega, \Pi)$ ,

A set X of variables

# **Syntax**

#### Given:

- A signature  $\Sigma = (\Omega, \Pi)$ ,
- A set X of variables
- Terms are defined as for classical logic
- Atomic formulae are defined as for classical logic

F, G, H	::=	$\perp$	(falsum)
		Т	(verum)
		A	(atomic formula)
		$\neg F$	(negation)
		$(F \land G)$	(conjunction)
		$(F \lor G)$	(disjunction)
		$(F \rightarrow G)$	(implication)
		$(F \leftrightarrow G)$	(equivalence)
		$\Box F$	
		◇F	
		$\forall x F$	(universal quantification)
		$\exists x F$	(existential quantification)

A Kripke structure K = (S, R, I) consists of Kripke frame F = (S, R) and a mapping I that assigns to each world  $s \in S$  a first-order structure

$$I(s) = (U_{I(s)}, \{f_{I(s)}\}_{f \in \Omega}, \{p_{I(s)}\}_{p \in \Pi})$$

such that, for each s,  $t \in S$  with sRt, I(s) is a substructure of I(t), i.e.:

- the universe of I(s) is a subset of the universe of I(t) (monotonicity), and
- the structures I(s) and I(t) agree on the interpretation of all function symbols on the (smaller) universe of I(s).

A Kripke structure (S, R, I) is called Kripke structure with constant domain if all the models  $\{I(s) \mid s \in S\}$  are required to have the same universe.

#### Interpretation of quantified modal formulae

$(\mathcal{K},s)\models p(t_1,\ldots,t_k)$	iff	$I(s)\models p(t_1,\ldots,t_k)$ for atomic formulae $p(t_1,\ldots,t_k)$
$(\mathcal{K}, s) \models F \land G$	iff	$(\mathcal{K},s)\models F$ and $(\mathcal{K},s)\models G$
$(\mathcal{K}, s) \models F \lor G$	iff	$(\mathcal{K},s)\models F  ext{ or } (\mathcal{K},s)\models G$
$(\mathcal{K},s)\models F ightarrow G$	iff	$(\mathcal{K},s) \not\models F  ext{ or } (\mathcal{K},s) \models G$
$(\mathcal{K}, s) \models \neg F$	iff	$(\mathcal{K}, s) \not\models F$
$(\mathcal{K}, s) \models \Box F$	iff	for all $t$ with $R(s, t)$ , $(\mathcal{K}, s) \models F$
$(\mathcal{K}, s) \models \Diamond F$	iff	there exists $t$ with $R(s, t)$ and $(\mathcal{K}, s) \models F$
$(\mathcal{K}, s) \models \forall x F(x)$	iff	for all $d \in U_{I(s)}$ , $(\mathcal{K}, s) \models F(d)$
$(\mathcal{K}, s) \models \exists x F(x)$	iff	there exists $d \in U_{I(s)}$ , $(\mathcal{K},s) \models F(d)$

#### Interpretation of quantified modal formulae

$(\mathcal{K}, s) \models p(t_1, \ldots, t_k)$	iff	$I(s)\models p(t_1,\ldots,t_k)$ for atomic formulae $p(t_1,\ldots,t_k)$
$(\mathcal{K}, s) \models F \land G$	iff	$(\mathcal{K},s)\models F$ and $(\mathcal{K},s)\models G$
$(\mathcal{K}, s) \models F \lor G$	iff	$(\mathcal{K},s)\models F  ext{ or } (\mathcal{K},s)\models G$

$(\mathcal{K}, s) \models \neg F$	iff	$(\mathcal{K}, s) \not\models F$
$(\mathcal{K}, s) \models \Box F$	iff	for all $t$ with $R(s, t)$ , $(\mathcal{K}, s) \models F$
$(\mathcal{K}, s) \models \Diamond F$	iff	there exists $t$ with $R(s, t)$ and $(\mathcal{K}, s) \models F$
$(\mathcal{K}, s) \models \forall x F(x)$	iff	for all $d \in U_{I(s)}$ , $(\mathcal{K}, s) \models F(d)$
$(\mathcal{K}, s) \models \exists x F(x)$	iff	there exists $d \in U_{I(s)}$ , $(\mathcal{K}, s) \models F(d)$

**Goal:** formalize the last statements using variable assignments, as for first-order logic

A (variable) assignment, also called a valuation (over a given  $\Sigma$ -algebra  $\mathcal{A}$ ), is a map  $\beta : X \to \mathcal{A}$ .

**Goal:** formalize the last statements using variable assignments, as for first-order logic

A (variable) assignment, also called a valuation (over a given  $\Sigma$ -algebra  $\mathcal{A}$ ), is a map  $\beta : X \to \mathcal{A}$ .

**Difficulty**: the domains of the structures are different from world to world.

In varying domain semantics, quantifiers may possibly refer to a different set of objects, depending on the world.

In constant domain semantics, quantifiers refer to the same set of objects (same universe U) in all worlds.

```
Variable assignment: \beta : X \rightarrow U.
```

Evaluation of quantified formulae as in classical first-order logic.

Tableau calculi

Translation to first-order logic and resolution

### Tableau calculi

need to take into account  $\gamma$  and  $\delta$  rules (as for classical first-order logic)

### **Translation to first-order logic and resolution**

out of the scope of this lecture

First-order dynamic logic (DL) extends PDL (although DL had been developed first) to a first-order logic and gives concrete atomic programs with specific effects, as opposed to abstract atomic programs with unknown effects as in PDL.

**Definition.** Let X be a set of variables. The set  $\text{Fma}^{DL}$  of formulas of dynamic logic and the set of programs Prog are defined by simultaneous induction as:

- $\bot, \top \in \mathsf{Fma}^{DL}$  (propositional constants)
- All instances of formulas of first-order logic are in Fma<sup>DL</sup>
- If  $F, G \in \mathsf{Fma}^{DL}$  then  $\neg F, (F \land G), (F \lor G) \in \mathsf{Fma}^{DL}$
- If  $F \in \operatorname{Fma}^{DL}$  and  $x \in X$  is a variable then  $\forall xF, \exists xF \in \operatorname{Fma}^{DL}$
- If  $F \in \operatorname{Fma}^{DL}$ ,  $\alpha \in \operatorname{Prog}$  then  $[\alpha]F$ ,  $\langle \alpha \rangle F \in \operatorname{Fma}^{DL}$
- $(x := t) \in Prog$  are atomic programs for variables  $x \in X$  and terms t.
- If  $F \in \operatorname{Fma}^{DL}$  then  $F? \in \operatorname{Prog}$ .
- If  $\alpha, \beta \in \mathsf{Prog}$  then  $\alpha; \beta, \alpha \cup \beta, \alpha^* \in \mathsf{Prog}$ .

The semantics of DL is extended from that of PDL in the obvious way where the set of states is chosen to be  $W := D^X$ , i.e., the set of assignments  $s : X \to D$  of elements of the domain D (of the first-order structure) to the variables X.

Predicate symbols, function symbols, and terms are interpreted as usual in first-order logic.

Because there are no other atomic programs, we only need to specify the accessibility relation belonging to an assignment x := t:

$$R(x := t) = \{(s, s') \mid s'(x) = s(t) \text{ and } s'(z) = s(z) \text{ for all } z \neq x\}$$

DL can inherit the axioms of first-order logic and of PDL. One typical axiom that DL needs in addition is an axiom that relates assignment to substitution:

$$(D15) \quad \langle x := t \rangle F \leftrightarrow F_x^t$$

It says that formula F is true after assigning t to x if and only if F is true after substituting the new value t for x.

DL cannot be decidable because it includes first-order logic, where validity is only semidecidable.

But DL does not have a sound and complete effective calculus. Note here that DL formulas can state the halting problem for Turing machines. Nevertheless, there are proofs showing that DL has a relatively complete or arithmetically complete proof calculus.
