## Part 5: Complexity (Part 1)

16.01.2019

Viorica Sofronie-Stokkermans

Universität Koblenz-Landau

e-mail: [sofronie@uni-koblenz.de](mailto:sofronie@uni-koblenz.de)

# Contents

---

- Recall: Turing machines and Turing computability
- Register machines (LOOP, WHILE, GOTO)
- Recursive functions
- The Church-Turing Thesis
- Computability and (Un-)decidability
- **Complexity**

# Motivation (The pragmatical view)

---

Assume you are employed as software designer.

One day, your boss calls you into his office and tells you that the company is about to enter a very competitive market, for which it is essential to know how to solve (efficiently) problem  $X$ .

Your charge is to find an efficient algorithm for solving this problem.

# Motivation (The pragmatical view)

---

What you certainly don't want:

"I can't find an efficient algorithm. I guess I'm just to dumb"

(Garey, Johnson, 1979)

# Motivation (The pragmatical view)

---

Much better:

"I can't find an efficient algorithm, because no such algorithm is possible!"

(Garey, Johnson, 1979)

# Motivation

---

In this lecture we showed how to prove that certain problems do not have a (terminating) algorithmic solution

↳ undecidability results

In the next weeks we will show that even decidable problems are “intractable” in the sense that they have a high complexity.

Unfortunately, proving undecidability or inherent intractability can be just as hard as finding efficient algorithms.

# The pragmatical view

---

However, we will see that you can often answer:

"I can't find an efficient algorithm, but neither can all these famous people."

(Garey, Johnson, 1979)

# Motivation

---

## Goals:

- Define formally time and space complexity
- Define a family of “complexity classes”: P, NP, PSPACE, ...
- Study the links between complexity classes
- Learn how to show that a problem is in a certain complexity class
  - Reductions to problems known to be in the complexity class
- Closure of complexity classes

We will give examples of problems from various areas and study their complexity.

# Complexity

---

- Recall:
  - Big O notation
  - The structure of PSPACE
  - Complete problems; hard problems
  - Examples

# Big O notation

---

**Definition.** Let  $h, f : \mathbb{N} \rightarrow \mathbb{R}$  functions.

The function  $h$  is in the class  $O(f)$  iff there exists  $c \in \mathbb{R}$ ,  $c > 0$  and there exists  $n_0 \in \mathbb{N}$  such that for all  $n \geq n_0$   $|h(n)| \leq c|f(n)|$ .

**Notation:**  $f \in O(h)$ , sometimes also  $f(n) \in O(h(n))$ ;  
by abuse of notation denoted also by  $f = O(h)$

**Examples:**

$$5n + 4 \in O(n)$$

$$5n + n^2 \notin O(n)$$

$$\binom{n}{2} = \frac{n(n-1)}{2} \in O(n^2)$$

Let  $p$  be a polynomial of degree  $m$ . Then  $p(n) \in O(n^m)$

# Big O notation

---

## Computation rules for O

- $f \in O(f)$
- $c \cdot O(f) = O(f)$
- $O(O(f)) = O(f)$
- $O(f) \cdot O(g) = O(f \cdot g)$
- $O(f \cdot g) = |f|O(g)$
- If  $|f| \leq |g|$  then  $O(f) \subseteq O(g)$

**Lemma.** The following hold:

- $\forall d > 0, n^{d+1} \notin O(n^d)$
- $\forall r > 1 \forall d (r^n \notin O(n^d) \text{ and } n^d \in O(r^n))$

# Complexity

---

## Types of complexity

- Time complexity
- Space complexity

# DTIME and NTIME

---

**Basic model:**  $k$ -DTM or  $k$ -NTM  $M$  (one tape for the input)

If  $M$  makes for every input word of length  $n$  at most  $T(n)$  steps, then  $M$  is  $T(n)$ -time bounded.

In this case, the language accepted by  $M$  has time complexity  $T(n)$ ; (more precisely  $\max(n + 1, T(n))$ ).

**Definition** ( $NTIME(T(n)), DTIME(T(n))$ )

- $DTIME(T(n))$  class of all languages accepted by  $T(n)$ -time bounded DTMs.
- $NTIME(T(n))$  class of all languages accepted by  $T(n)$ -time bounded NTMs.

# DSPACE and NSPACE

---

**Basic model:**  $k$ -DTM or  $k$ -NTM  $M$  with special tape for the input (is read-only) +  $k$  storage tapes (offline DTM)  $\mapsto$  needed if  $S(n)$  sublinear

If  $M$  needs, for every input word of length  $n$ , at most  $S(n)$  cells on the storage tapes then  $M$  is  $S(n)$ -space bounded.

The language accepted by  $M$  has space complexity  $S(n)$ ;  
(more precisely  $\max(1, S(n))$ ).

**Definition** ( $NSPACE(S(n)), DSPACE(S(n))$ )

- $DSPACE(S(n))$  class of all languages accepted by  $S(n)$ -space bounded DTMs.
- $NSPACE(S(n))$  class of all languages accepted by  $S(n)$ -space bounded NTMs.

# Example

---

To which time/space complexity does the following language belong:

$$L_{\text{mirror}} = \{wcw^R \mid w \in \{0, 1\}^*\}$$

# Example

---

To which time/space complexity does the following language belong:

$$L_{\text{mirror}} = \{wcw^R \mid w \in \{0, 1\}^*\}$$

**Time:**  $DTIME(n + 1)$ : copy input to the right of  $c$  in reverse order. When  $c$  is found, the rest is compared with the copy of  $w$  on the tape.

**Space:**  $DSPACE(n)$ : previous DTM

# Example

---

To which time/space complexity does the following language belong:

$$L_{\text{mirror}} = \{wcw^R \mid w \in \{0, 1\}^*\}$$

**Time:**  $DTIME(n + 1)$ : copy input to the right of  $c$  in reverse order. When  $c$  is found, the rest is compared with the copy of  $w$  on the tape.

**Space:**  $DSPACE(n)$ : previous DTM

Even better  $DSPACE(\log(n))$ : use two tapes as binary counters.

1. the input is checked for the occurrence of just one  $c$  and an equal number of symbols to the left and right of  $c$ . This needs only constant space, resp. it can be done with a number of states (and thus needs no space at all).
2. we check the right and left part symbol by symbol: to do this we just have to keep in mind the two positions to be checked (for equality) (and they are coded on the two tapes).

Remember: definition of  $DSPACE$  does not count the space used on the input tape.

# Questions

---

**Time:** Is any language in  $DTIME(f(n))$  decided by some DTM?

**Space:** Is any language in  $DSPACE(f(n))$  decided by some DTM?

The functions  $f$  are usually very simple functions; in particular they are all computable.

We will consider e.g. powers  $f(n) = n^k$ .

# Questions

---

**Time:** Is any language in  $DTIME(f(n))$  decided by some DTM?

**Space:** Is any language in  $DSPACE(f(n))$  decided by some DTM?

The functions  $f$  are usually are very simple functions; in particular they are all computable.

We will consider e.g. powers  $f(n) = n^k$ .

**Time/Space:** What about  $NTIME(f(n))$ ,  $NSPACE(f(n))$

**Time vs. Space:** What are the links between  $DTIME(f(n))$ ,  $DSPACE(f(n))$ ,  $NTIME(f(n))$ ,  $NSPACE(f(n))$

# Questions

---

- Time bounded**    What does it mean that a DTM makes at most  $n$  steps?  
Strictly speaking, after  $n$  steps it should halt or hang.
- Halt?**    Input is accepted
- Hang?**    DTM on band which is infinite on both sides **cannot hang!**

# Questions

---

**Time bounded** What does it mean that a DTM makes at most  $n$  steps?  
Strictly speaking, after  $n$  steps it should halt or hang.

**Halt?** Input is accepted

**Hang?** DTM on band which is infinite on both sides **cannot hang!**

## Stop after $n$ steps

**Stop:** We understand the following under  $M$  makes at most  $n$  steps:

- It halts (and accepts the input) within  $n$  steps
- It hangs (and does not accept the input) within  $n$  steps
- It halts after  $n$  steps, but not in halting mode, so it does not accept the input.

# Answers

---

## Answers (Informally)

**Time:** Every language from  $DTIME(f(n))$  is decidable:  
for an input of length  $n$  we wait as long as the value  $f(n)$ .  
If until then no answer “YES” then the answer is “NO”.

**Space:** Every language from  $DSPACE(f(n))$  is decidable:  
There are only finitely many configurations. We write all configurations.  
If the TM does not halt then there is a loop. This can be detected.

# Answers

---

## Answers (Informally)

**NTM vs. DTM:** Clearly,  $DTIME(f(n)) \subseteq NTIME(f(n))$  and  
 $DSPACE(f(n)) \subseteq NSPACE(f(n))$

If we try to simulate an NTM with a DTM we may need exponentially more time. Therefore:

$$NTIME(f(n)) \subseteq DTIME(2^{h(n)}) \text{ where } h \in O(f).$$

For the space complexity we can show that:

$$NSPACE(f(n)) \subseteq DSPACE(f^2(n))$$

**Time vs. Space:** Clearly,  $DTIME(f(n)) \subseteq DSPACE(f(n))$  and  
 $NTIME(f(n)) \subseteq NSPACE(f(n))$   
 $DSPACE(f(n)), NSPACE(f(n))$  are much larger.

# Question

---

## What about constant factors?

Constant factors are ignored. Only the rate of growth of a function in complexity classes is important.

### Theorem.

For every  $c \in \mathbb{R}^+$  and every storage function  $S(n)$  the following hold:

- $DSPACE(S(n)) = DSPACE(cS(n))$
- $NSPACE(S(n)) = NSPACE(cS(n))$

**Proof (Idea).** One direction is trivial. The other direction can be proved by representing a fixed amount  $r > \frac{2}{c}$  of neighboring cells on the tape as a new symbol.

The states of the new machine simulate the movements of the read/write head as transitions. For  $r$ -cells of the old machine we use only two: in the most unfavourable case when we go from one block to another.

# Time acceleration

---

**Theorem** For every  $c \in \mathbb{R}^+$  and every time function  $T(n)$  with  $\lim_{n \rightarrow \infty} \frac{T(n)}{n} = \infty$  the following hold:

- $DTIME(T(n)) = DTIME(cT(n))$
- $NTIME(T(n)) = NTIME(cT(n))$

**Proof (Idea).** One direction is trivial. The other direction can be proved by representing a fixed amount  $r > \frac{4}{c}$  of neighboring cells on the tape as a new symbol.

The states of the new machine simulate also now which symbol and which position the read/write head of the initial machine has. When the machine is simulated the new machine needs to make 4 steps instead of  $r$ : 2 in order to write on the new fields and 2 in order to move the head on the new field and then back on the old (in the worst case).

# Big O notation

---

**Theorem:** Let  $T$  be a time function with  $\lim_{n \rightarrow \infty} \frac{T(n)}{n} = \infty$  and  $S$  a storage function.

(a) If  $f(n) \in O(T(n))$  then  $D\text{TIME}(f(n)) \subseteq D\text{TIME}(T(n))$ .

(b) If  $g(n) \in O(S(n))$  then  $D\text{SPACE}(g(n)) \subseteq D\text{SPACE}(S(n))$ .

# P, NP, PSPACE

---

## Definition

$$\begin{aligned} P &= \bigcup_{i \geq 1} DTIME(n^i) \\ NP &= \bigcup_{i \geq 1} NTIME(n^i) \\ PSPACE &= \bigcup_{i \geq 1} DSPACE(n^i) \end{aligned}$$

# P, NP, PSPACE

---

## Definition

$$\begin{aligned} P &= \bigcup_{i \geq 1} DTIME(n^i) \\ NP &= \bigcup_{i \geq 1} NTIME(n^i) \\ PSPACE &= \bigcup_{i \geq 1} DSPACE(n^i) \end{aligned}$$

**Lemma**  $NP \subseteq \bigcup_{i \geq 1} DTIME(2^{O(n^d)})$

**Proof:** Follows from the fact that if  $L$  is accepted by a  $f(n)$ -time bounded NTM then  $L$  is accepted by an  $2^{O(f(n))}$ -time bounded DTM, hence for every  $d \geq 1$  we have:

$$NTIME(n^d) \subseteq DTIME(2^{O(n^d)})$$

# P, NP, PSPACE

---

$$\begin{aligned} P &= \bigcup_{i \geq 1} DTIME(n^i) \\ NP &= \bigcup_{i \geq 1} NTIME(n^i) \\ PSPACE &= \bigcup_{i \geq 1} DSPACE(n^i) \\ NP &\subseteq \bigcup_{i \geq 1} DTIME(2^{O(n^d)}) \end{aligned}$$

## Intuition

- Problems in  $P$  can be solved efficiently; those in  $NP$  can be solved in exponential time
- $PSPACE$  is a very large class, much larger than  $P$  and  $NP$ .

# Complexity classes for functions

---

## Definition

A function  $f : \mathbb{N} \rightarrow \mathbb{N}$  is in P if there exists a DTM  $M$  and a polynomial  $p(n)$  such that for every  $n$  the value  $f(n)$  can be computed by  $M$  in at most  $p(\text{length}(n))$  steps.

Here  $\text{length}(n) = \log(n)$ : we need  $\log(n)$  symbols to represent (binary) the number  $n$ .

The other complexity classes for functions are defined in an analogous way.

# Relationships between complexity classes

---

## Question:

Which are the links between the complexity classes P, NP and PSPACE?

# Relationships between complexity classes

---

## Question:

Which are the links between the complexity classes P, NP and PSPACE?

$$P \subseteq NP \subseteq PSPACE$$

# Complexity classes

---

How do we show that a certain problem is in a certain complexity class?

# Complexity classes

---

How do we show that a certain problem is in a certain complexity class?

**Reduction to a known problem**

We need one problem we can start with!      SAT

# Complexity classes

---

Can we find in NP problems which are the most difficult ones in NP?

# Complexity classes

---

Can we find in NP problems which are the most difficult ones in NP?

## Answer

There are various ways of defining “the most difficult problem”.

They depend on the notion of reducibility which we use.

For a given notion of reducibility the answer is YES.

Such problems are called **complete in the complexity class** with respect to the notion of reducibility used.

# Reduction

---

## Definition (Polynomial time reducibility)

Let  $L_1, L_2$  be languages.

$L_2$  is polynomial time reducible to  $L_1$  (notation:  $L_2 \preceq_{\text{pol}} L_1$ )

if there exists a polynomial time bounded DTM, which for every input  $w$  computes an output  $f(w)$  such that

$$w \in L_2 \text{ if and only if } f(w) \in L_1$$

# Reduction

---

## Lemma (Polynomial time reduction)

- Let  $L_2$  be polynomial time reducible to  $L_1$  ( $L_2 \preceq_{\text{pol}} L_1$ ). Then:
  - If  $L_1 \in NP$  then  $L_2 \in NP$ .
  - If  $L_1 \in P$  then  $L_2 \in P$ .
- The composition of two polynomial time reductions is again a polynomial time reduction.

# Reduction

---

## Lemma (Polynomial time reduction)

- Let  $L_2$  be polynomial time reducible to  $L_1$  ( $L_2 \preceq_{\text{pol}} L_1$ ). Then:
  - If  $L_1 \in NP$  then  $L_2 \in NP$ .
  - If  $L_1 \in P$  then  $L_2 \in P$ .
- The composition of two polynomial time reductions is again a polynomial time reduction.

**Proof:** Assume  $L_1 \in P$ . Then there exists  $k \geq 1$  such that  $L_1$  is accepted by  $n^k$ -time bounded DTM  $M_1$ .

Since  $L_2 \preceq_{\text{pol}} L_1$  there exists a polynomial time bounded DTM  $M_f$ , which for every input  $w$  computes an output  $f(w)$  such that  $w \in L_2$  if and only if  $f(w) \in L_1$ .

Let  $M_2 = M_f M_1$ . Clearly,  $M_2$  accepts  $L_2$ . We have to show that  $M_2$  is polynomial time bounded.  $w \mapsto M_f$  computes  $f(w)$  (pol.size)  $\mapsto M_1$  decides if  $f(w) \in L_1$  (polynomially many steps)

# NP

---

## Theorem (Characterisation of NP)

A language  $L$  is in NP if and only if there exists a language  $L'$  in P and a  $k \geq 0$  such that for all  $w \in \Sigma^*$ :

$$w \in L \text{ iff } \text{there exists } c : \langle w, c \rangle \in L' \text{ and } |c| < |w|^k$$

$c$  is also called **witness** or **certificate** for  $w$  in  $L$ .

A DTM which accepts the language  $L'$  is called **verifier**.

## Important

A decision procedure is in NP iff every “Yes” instance has a short witness (i.e. its length is polynomial in the length of the input) which can be verified in polynomial time.

# Complete and hard problems

---

## Definition (NP-complete, NP-hard)

- A language  $L$  is NP-hard (NP-difficult) if every language  $L'$  in NP is reducible in polynomial time to  $L$ .
- A language  $L$  is NP-complete if:
  - $L \in NP$
  - $L$  is NP-hard

# Complete and hard problems

---

## Definition (PSPACE-complete, PSPACE-hard)

- A language  $L$  is PSPACE-hard (PSPACE-difficult) if every language  $L'$  in PSPACE is reducible in polynomial time to  $L$ .
- A language  $L$  is PSPACE-complete if:
  - $L \in PSPACE$
  - $L$  is PSPACE-hard

# Complete and hard problems

---

## Remarks:

- If we can prove that at least one NP-hard problem is in P then  $P = NP$
- If  $P \neq NP$  then no NP complete problem can be solved in polynomial time

**Open problem:** Is  $P = NP$ ? (Millenium Problem)

# Complete and hard problems

---

How to show that a language  $L$  is NP-complete?

1. Prove that  $L \in NP$
2. Find a language  $L'$  known to be NP-complete and reduce it to  $L$

# Complete and hard problems

---

How to show that a language  $L$  is NP-complete?

1. Prove that  $L \in NP$
2. Find a language  $L'$  known to be NP-complete and reduce it to  $L$

Is this sufficient?

# Complete and hard problems

---

How to show that a language  $L$  is NP-complete?

1. Prove that  $L \in NP$
2. Find a language  $L'$  known to be NP-complete and reduce it to  $L$

Is this sufficient?

Yes.

If  $L'$  is NP-complete then every language in NP is reducible to  $L'$ , therefore also to  $L$ .

# Complete and hard problems

---

How to show that a language  $L$  is NP-complete?

1. Prove that  $L \in NP$
2. Find a language  $L'$  known to be NP-complete and reduce it to  $L$

Is this sufficient?

Yes.

If  $L' \in NP$  then every language in NP is reducible to  $L'$  and therefore also to  $L$ .

**Often used:** the SAT problem (Proved to be NP-complete by S. Cook)

$$L' = L_{\text{sat}} = \{w \mid w \text{ is a satisfiable formula of propositional logic}\}$$

# Stephen Cook

---

## Stephen Arthur Cook (born 1939)

- Major contributions to complexity theory.  
Considered one of the forefathers of computational complexity theory.
- 1971 'The Complexity of Theorem Proving Procedures'  
Formalized the notions of polynomial-time reduction and NP-completeness, and proved the existence of an NP-complete problem by showing that the Boolean satisfiability problem (SAT) is NP-complete.
- Currently University Professor at the University of Toronto
- 1982: Turing award for his contributions to complexity theory.
