Complexity classes

How do we show that a certain problem is in a certain complexity class?

Reduction to a known problem

We need one problem we can start with! (for NP: SAT)

Reduction

Definition (Polynomial time reducibility)

Let L_1, L_2 be languages.

L_2 is polynomial time reducible to L_1 (notation: $L_2 \preceq_{\text{pol}} L_1$)

if there exists a polynomial time bounded DTM, which for every input w computes an output $f(w)$ such that

$$w \in L_2 \text{ if and only if } f(w) \in L_1$$

Lemma (Polynomial time reduction)

- Let L_2 be polynomial time reducible to L_1 ($L_2 \preceq_{\text{pol}} L_1$). Then:
 - If $L_1 \in NP$ then $L_2 \in NP$.
 - If $L_1 \in P$ then $L_2 \in P$.
- The composition of two polynomial time reductions is again a polynomial time reduction.

Complete and hard problems

Definition (NP-complete, NP-hard)

- A language L is NP-hard (NP-difficult) if every language L' in NP is reducible in polynomial time to L .
- A language L is NP-complete if:
 - $L \in NP$
 - L is NP-hard

Definition (PSPACE-complete, PSPACE-hard)

- A language L is PSPACE-hard (PSPACE-difficult) if every language L' in PSPACE is reducible in polynomial time to L .
- A language L is PSPACE-complete if:
 - $L \in PSPACE$
 - L is PSPACE-hard

Complete and hard problems

Remarks:

- If we can prove that at least one NP-hard problem is in P then $P = NP$
- If $P \neq NP$ then no NP complete problem can be solved in polynomial time

Open problem: Is $P = NP$? (Millenium Problem)

How to show that a language L is NP-complete?

1. Prove that $L \in NP$
2. Find a language L' known to be NP-complete and reduce it to L

Often used: the SAT problem (Proved to be NP-complete by S. Cook)

$$L' = L_{\text{sat}} = \{w \mid w \text{ is a satisfiable formula of propositional logic}\}$$

Cook's theorem

Theorem $SAT = \{w \mid w \text{ is a satisfiable formula of propositional logic}\}$
is NP-complete.

Cook's theorem

Theorem $SAT = \{w \mid w \text{ is a satisfiable formula of propositional logic}\}$
is NP-complete.

Proof (Idea)

To show: (1) $SAT \in NP$
(2) for all $L \in NP$, $L \preceq_{\text{pol}} SAT$

Cook's theorem

Theorem $SAT = \{w \mid w \text{ is a satisfiable formula of propositional logic}\}$ is NP-complete.

Proof (Idea)

To show: (1) $SAT \in NP$
(2) for all $L \in NP$, $L \preceq_{\text{pol}} SAT$

(1) Construct a k -tape NTM M which can accept SAT in polynomial time:

$w \in \Sigma_{PL}^*$ \mapsto M does not halt if $w \notin SAT$

M finds in polynomial time a satisfying assignment

- (a) scan w and see if it a well-formed formula; collect atoms $\mapsto O(|w|^2)$
- (b) if not well-formed: inf.loop; if well-formed M guesses a satisfying assignment $\mapsto O(|w|)$
- (c) check whether w true under the assignment $\mapsto O(p(|w|))$
- (d) if false: inf.loop; otherwise halt.

“guess (satisfying) assignment \mathcal{A} ; check in polynomial time that formula true under \mathcal{A} ”

Cook's theorem

Theorem $SAT = \{w \mid w \text{ is a satisfiable formula of propositional logic}\}$ is NP-complete.

Proof (Idea) (2) We show that for all $L \in NP$, $L \preceq_{\text{pol}} SAT$

- We show that we can simulate the way a NTM works using propositional logic.
- Let $L \in NP$. There exists a p -time bounded NTM which accepts L . (Assume w.l.o.g. that M has only one tape and does not hang.)

For M and w we define a propositional logic language and a formula $T_{M,w}$ such that

M accepts w iff $T_{M,w}$ is satisfiable.

- We show that the map f with $f(w) = T_{M,w}$ has polynomial complexity.

Closure of complexity classes

P, PSPACE are closed under complement

All complexity classes which are defined in terms of deterministic Turing machines are closed under complement.

Proof: If a language L is in such a class then also its complement is
(run the machine for L and revert the output)

Closure of complexity classes

Is NP closed under complement?

Closure of complexity classes

Is NP closed under complement?

Nobody knows!

Definition

co-NP is the class of all languages for which the complement is in NP

$$\text{co-NP} = \{L \mid \bar{L} \in \text{NP}\}$$

Relationships between complexity classes

It is not yet known whether the following relationships hold:

$$P \stackrel{?}{=} NP$$

$$NP \stackrel{?}{=} \text{co-NP}$$

$$P \stackrel{?}{=} \text{PSPACE}$$

$$NP \stackrel{?}{=} \text{PSPACE}$$

Examples of NP-complete problems

Examples of NP-complete problems:

1. Is a logical formula satisfiable? (SAT, 3-CNF-SAT)
2. Does a graph contain a clique of size k ? (Clique of size k)
3. Is a (un)directed graph hamiltonian? (Hamiltonian circle)
4. Can a graph be colored with three colors? (3-colorability)
5. Has a set of integers a subset with sum x ? (subset sum)
6. Rucksack problem (knapsack)
7. Multiprocessor scheduling

Examples of NP-complete problems

Examples of NP-complete problems:

1. Is a logical formula satisfiable? (SAT, 3-CNF-SAT)
2. Does a graph contain a clique of size k ? (Clique of size k)
3. Is a (un)directed graph hamiltonian? (Hamiltonian circle)
4. Can a graph be colored with three colors? (3-colorability)
5. Has a set of integers a subset with sum x ? (subset sum)
6. Rucksack problem (knapsack)
7. Multiprocessor scheduling

Examples of NP-complete problems

Definition (CNF, DNF, k -CNF, k -DNF)

DNF: A formula is in DNF if it has the form

$$(L_1^1 \wedge \cdots \wedge L_{n_1}^1) \vee \cdots \vee (L_1^m \wedge \cdots \wedge L_{n_m}^m)$$

CNF: A formula is in CNF if it has the form

$$(L_1^1 \vee \cdots \vee L_{n_1}^1) \wedge \cdots \wedge (L_1^m \vee \cdots \vee L_{n_m}^m)$$

k -DNF: A formula is in k -DNF if it is in DNF and all its conjunctions have k literals

k -CNF: A formula is in k -CNF if it is in CNF and all its disjunctions have k literals

Examples of NP-complete problems

$SAT = \{w \mid w \text{ is a satisfiable formula of propositional logic}\}$

$CNF-SAT = \{w \mid w \text{ is a satisfiable formula of propositional logic in CNF}\}$

$k\text{-CNF-SAT} = \{w \mid w \text{ is a satisfiable formula of propositional logic in } k\text{-CNF}\}$

Examples of NP-complete problems

Theorem

The following problems are in NP and are NP-complete:

- (1) SAT
- (2) CNF-SAT
- (3) k -CNF-SAT for $k \geq 3$

Examples of NP-complete problems

Theorem

The following problems are in NP and are NP-complete:

- (1) SAT
- (2) CNF-SAT
- (3) k -CNF-SAT for $k \geq 3$

Proof: (1) SAT is NP-complete by Cook's theorem.

CNF-SAT and k -CNF-SAT are clearly in NP.

(3) We show that 3-CNF-SAT is NP-hard. For this, we construct a polynomial reduction of SAT to 3-CNF-SAT.

Examples of NP-complete problems

Proof: (ctd.) Polynomial reduction of SAT to 3-CNF.

Let F be a propositional formula of length n

Step 1 Move negation inwards (compute the negation normal form) $\mapsto O(n)$

Step 2 Fully bracket the formula $\mapsto O(n)$

$$P \wedge Q \wedge R \mapsto (P \wedge Q) \wedge R$$

Step 3 Starting from inside out replace subformula $Q \circ R$ with a new propositional variable $P_{Q \circ R}$ and add the formula $P_{Q \circ R} \rightarrow (Q \circ R)$ and $(Q \circ R) \rightarrow P_{Q \circ R}$ ($\circ \in \{\vee, \wedge\}$) $\mapsto O(p(n))$

Step 4 Write all formulae above as clauses $\mapsto \text{Rename}(F)$ $\mapsto O(n)$

Let $f : \Sigma^* \rightarrow \Sigma^*$ be defined by:

$f(F) = P_F \wedge \text{Rename}(F)$ if F is a well-formed formula
and $f(w) = \perp$ otherwise. Then:

$F \in \text{SAT}$ iff F is a satisfiable formula in prop. logic iff $P_F \wedge \text{Rename}(F)$ is satisfiable
iff $f(F) \in \text{3-CNF-SAT}$

Example

Let F be the following formula:

$$[(Q \wedge \neg P \wedge \neg(\neg(\neg Q \vee \neg R))) \vee (Q \wedge \neg P \wedge \neg(Q \wedge \neg P))] \wedge (P \vee R).$$

Step 1: After moving negations inwards we obtain the formula:

$$F_1 = [(Q \wedge \neg P \wedge (\neg Q \vee \neg R)) \vee (Q \wedge \neg P \wedge (\neg Q \vee P))] \wedge (P \vee R)$$

Step 2: After fully bracketing the formula we obtain:

$$F_2 = [((Q \wedge \neg P) \wedge (\neg Q \vee \neg R)) \vee ((Q \wedge \neg P) \wedge (\neg Q \vee P))] \wedge (P \vee R)$$

Step 3: Replace subformulae with new propositional variables (starting inside).

$$\begin{array}{c}
 \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee \neg R))}_{P_6} \vee \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_7} \wedge \underbrace{(P \vee R)}_{P_5} \\
 \underbrace{\underbrace{(Q \wedge \neg P)}_{P_1} \wedge \underbrace{(\neg Q \vee \neg R)}_{P_2}}_{P_6} \vee \underbrace{\underbrace{(Q \wedge \neg P)}_{P_1} \wedge \underbrace{(\neg Q \vee P)}_{P_4}}_{P_7} \wedge P_5 \\
 \underbrace{\underbrace{\underbrace{(Q \wedge \neg P)}_{P_1} \wedge \underbrace{(\neg Q \vee \neg R)}_{P_2}}_{P_6} \vee \underbrace{\underbrace{(Q \wedge \neg P)}_{P_1} \wedge \underbrace{(\neg Q \vee P)}_{P_4}}_{P_7}}_{P_8} \wedge P_5 \\
 \underbrace{\underbrace{\underbrace{\underbrace{(Q \wedge \neg P)}_{P_1} \wedge \underbrace{(\neg Q \vee \neg R)}_{P_2}}_{P_6} \vee \underbrace{\underbrace{(Q \wedge \neg P)}_{P_1} \wedge \underbrace{(\neg Q \vee P)}_{P_4}}_{P_7}}_{P_8} \wedge \underbrace{(P \vee R)}_{P_5}}_{P_F}
 \end{array}$$

Example

Step 3: Replace subformulae with new propositional variables (starting inside).

$$\begin{array}{c}
 \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee \neg R))}_{P_1} \vee \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_1} \wedge \underbrace{(P \vee R)}_{P_5} \\
 \underbrace{\underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee \neg R))}_{P_1} \wedge \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_4}}_{P_6} \vee \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_4} \wedge \underbrace{(P \vee R)}_{P_5} \\
 \underbrace{\underbrace{\underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee \neg R))}_{P_1} \wedge \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_4}}_{P_6} \vee \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_4}}_{P_7} \wedge \underbrace{(P \vee R)}_{P_5} \\
 \underbrace{\underbrace{\underbrace{\underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee \neg R))}_{P_1} \wedge \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_4}}_{P_6} \vee \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_4}}_{P_7} \wedge \underbrace{(P \vee R)}_{P_5}}_{P_8} \\
 \underbrace{\underbrace{\underbrace{\underbrace{\underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee \neg R))}_{P_1} \wedge \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_4}}_{P_6} \vee \underbrace{((Q \wedge \neg P) \wedge (\neg Q \vee P))}_{P_4}}_{P_7} \wedge \underbrace{(P \vee R)}_{P_5}}_{P_8}}_{P_F}
 \end{array}$$

F is satisfiable iff the following formula is satisfiable:

$$\begin{array}{l}
 P_F \wedge (P_F \leftrightarrow (P_8 \wedge P_5)) \wedge (P_1 \leftrightarrow (Q \wedge \neg P)) \\
 \wedge (P_8 \leftrightarrow (P_6 \vee P_7)) \wedge (P_2 \leftrightarrow (\neg Q \vee \neg R)) \\
 \wedge (P_6 \leftrightarrow (P_1 \wedge P_2)) \wedge (P_4 \leftrightarrow (\neg Q \vee P)) \\
 \wedge (P_7 \leftrightarrow (P_1 \wedge P_4)) \wedge (P_5 \leftrightarrow (P \vee R))
 \end{array}$$

can further exploit polarity

Example

Step 3: Replace subformulae with new propositional variables (starting inside).

$$\begin{array}{c}
 [(\underbrace{(Q \wedge \neg P)}_{P_1} \wedge \underbrace{(\neg Q \vee \neg R)}_{P_2}) \vee (\underbrace{(Q \wedge \neg P)}_{P_1} \wedge \underbrace{(\neg Q \vee P)}_{P_4})] \wedge \underbrace{(P \vee R)}_{P_5} \\
 \underbrace{\hspace{10em}}_{P_6} \quad \underbrace{\hspace{10em}}_{P_7} \\
 \underbrace{\hspace{20em}}_{P_8} \\
 \underbrace{\hspace{30em}}_{P_F}
 \end{array}$$

F is satisfiable iff the following formula is satisfiable:

$$\begin{array}{l}
 P_F \quad \wedge \quad (P_F \rightarrow (P_8 \wedge P_5)) \quad \wedge \quad (P_1 \rightarrow (Q \wedge \neg P)) \\
 \quad \wedge \quad (P_8 \rightarrow (P_6 \vee P_7)) \quad \wedge \quad (P_2 \rightarrow (\neg Q \vee \neg R)) \\
 \quad \wedge \quad (P_6 \rightarrow (P_1 \wedge P_2)) \quad \wedge \quad (P_4 \rightarrow (\neg Q \vee P)) \\
 \quad \wedge \quad (P_7 \rightarrow (P_1 \wedge P_4)) \quad \wedge \quad (P_5 \rightarrow (P \vee R))
 \end{array}$$

Example

F is satisfiable iff the following formula is satisfiable:

$$\begin{aligned} P_F &\wedge (P_F \rightarrow (P_8 \wedge P_5)) \wedge (P_1 \rightarrow (Q \wedge \neg P)) \\ &\wedge (P_8 \rightarrow (P_6 \vee P_7)) \wedge (P_2 \rightarrow (\neg Q \vee \neg R)) \\ &\wedge (P_6 \rightarrow (P_1 \wedge P_2)) \wedge (P_4 \rightarrow (\neg Q \vee P)) \\ &\wedge (P_7 \rightarrow (P_1 \wedge P_4)) \wedge (P_5 \rightarrow (P \vee R)) \end{aligned}$$

Step 4: Compute the CNF (at most 3 literals per clause)

$$\begin{aligned} P_F &\wedge (\neg P_F \vee P_8) \wedge (\neg P_F \vee P_5) \wedge (\neg P_1 \vee Q) \wedge (\neg P_1 \vee \neg P) \\ &\wedge (\neg P_8 \vee P_6 \vee P_7) \wedge (\neg P_2 \vee \neg Q \vee \neg R) \\ &\wedge (\neg P_6 \vee P_1) \wedge (\neg P_6 \vee P_2) \wedge (\neg P_4 \vee \neg Q \vee P) \\ &\wedge (\neg P_7 \vee P_1) \wedge (\neg P_7 \vee P_4) \wedge (\neg P_5 \vee P \vee R) \end{aligned}$$

Examples of NP-complete problems

Proof: (ctd.) It immediately follows that CNF and k -CNF are *NP*-complete

Polynomial reduction from 3-CNF-SAT to CNF-SAT:

$f(F) = F$ for every formula in 3-CNF-SAT and \perp otherwise.

$F \in 3\text{-CNF-SAT}$ iff $f(F) = F \in \text{CNF-SAT}$.

Polynomial reduction from 3-CNF-SAT to k -CNF-SAT, $k > 3$

For every formula in 3-CNF-SAT:

$f(F) = F'$ (where F' is obtained from F by replacing a literal L with $\underbrace{L \vee \dots \vee L}_{k-2 \text{ times}}$).

$f(w) = \perp$ otherwise.

$F \in 3\text{-CNF-SAT}$ iff $f(F) = F' \in k\text{-CNF-SAT}$ (because $F' \equiv F$)

Examples of problems in P

Theorem

The following problems are in P:

- (1) DNF
- (2) k -DNF for all k
- (3) 2-CNF

(1) Let $F = (L_1^1 \wedge \dots \wedge L_{n_1}^1) \vee \dots \vee (L_1^m \wedge \dots \wedge L_{n_m}^m)$ be a formula in DNF.

F is satisfiable iff for some i : $(L_1^i \wedge \dots \wedge L_{n_i}^i)$ is satisfiable. A conjunction of literals is satisfiable iff it does not contain complementary literals.

(2) follows from (1)

(3) Finite set of 2-CNF formulae over a finite set of propositional variables. Resolution \mapsto at most quadratically many inferences needed.

Examples of NP-complete problems

Examples of NP-complete problems:

1. Is a logical formula satisfiable? (SAT)
2. Does a graph contain a clique of size k ?
3. Rucksack problem
4. Is a (un)directed graph hamiltonian?
5. Can a graph be colored with three colors?
6. Multiprocessor scheduling

Examples of NP-complete problems

Definition

A clique in a graph G is a complete subgraph of G .

Clique = $\{(G, k) \mid G \text{ is an undirected graph which has a clique of size } k\}$

Examples of NP-complete problems

Theorem Clique is NP-complete.

Proof: (1) We show that Clique is in *NP*:

We can construct for instance an NTM which accepts Clique.

- M builds a set V' of nodes (subset of the nodes of G) by choosing k nodes of G (we say that M “guesses” V').
- M checks for all nodes in V' if there are nodes to all other nodes. (this can be done in polynomial time)

“guess a subgraph with k vertices; check in polynomial time that it is a clique”

Examples of NP-complete problems

Theorem Clique is NP-complete.

Proof: (2) We show that Clique is *NP*-hard by showing that $3\text{-CNF-SAT} \preceq_{\text{pol}} \text{Clique}$.

Let \mathcal{G} be the set of all undirected graphs. We want to construct a map f (DTM computable in polynomial time) which associates with every formula F a pair $(G_F, k_F) \in \mathcal{G} \times \mathbb{N}$ such that

$F \in 3\text{-CNF-SAT}$ iff G_F has a clique of size k_F .

$F \in 3\text{-CNF} \Rightarrow F = (L_1^1 \vee L_2^1 \vee L_3^1) \wedge \cdots \wedge (L_1^m \vee L_2^m \vee L_3^m)$

F satisfiable iff there exists an assignment \mathcal{A} such that in every clause in F at least one literal is true and it is impossible that P and $\neg P$ are true at the same time.

Examples of NP-complete problems

Theorem Clique is NP-complete.

Proof: (ctd.) Let $k_F := m$ (the number of clauses). We construct G_F as follows:

- **Vertices:** all literals in F .
- **Edges:** We have an edge between two literals if they (i) can become true in the same assignment and (ii) belong to different clauses.

Then:

(1) $f(F)$ is computable in polynomial time.

(2) The following are equivalent:

- (a) G_F has a clique of size k_F .
- (b) There exists a set of nodes $\{L_{i_1}^1, \dots, L_{i_m}^m\}$ in G_F which does not contain complementary literals.
- (c) There exists an assignment which makes F true.
- (d) F is satisfiable.

Examples of NP-complete problems

Examples of NP-complete problems:

1. Is a logical formula satisfiable? (SAT, 3-CNF-SAT)
2. Does a graph contain a clique of size k ?
3. Rucksack problem
4. Is a (un)directed graph hamiltonian?
5. Can a graph be colored with three colors?
6. Multiprocessor scheduling

Examples of NP-complete problems

Examples of NP-complete problems:

1. Is a logical formula satisfiable? (SAT)
2. Does a graph contain a clique of size k ?
3. Rucksack problem
4. Can a graph be colored with three colors?
5. Is a (un)directed graph hamiltonian?
6. Multiprocessor scheduling

Examples of NP-complete problems

Definition (Rucksack problem)

A rucksack problem consists of:

- n objects with weights a_1, \dots, a_n
- a maximum weight b

The rucksack problem is solvable if there exists a subset of the given objects with total weight b .

$$\text{Rucksack} = \{(b, a_1, \dots, a_n) \in \mathbb{N}^{n+1} \mid \exists I \subseteq \{1, \dots, n\} \text{ s.t. } \sum_{i \in I} a_i = b\}$$

Examples of NP-complete problems

Theorem Rucksack is NP-complete.

Proof: (1) Rucksack is in NP: We guess I and check whether $\sum_{i \in I} a_i = b$

Examples of NP-complete problems

Theorem Rucksack is NP-complete.

Proof: (1) Rucksack is in NP: We guess I and check whether $\sum_{i \in I} a_i = b$

(2) Rucksack is NP-hard: We show that 3-CNF-SAT \prec_{pol} Rucksack.

Construct $f : 3\text{-CNF} \rightarrow \mathbb{N}^*$ as follows.

Consider a 3-CNF formula $F = (L_1^1 \vee L_2^1 \vee L_3^1) \wedge \dots \wedge (L_1^m \vee L_2^m \vee L_3^m)$

$f(F) = (b, a_1, \dots, a_n)$ where:

(i) a_i encodes which atom occurs in which clause as follows:

p_i positive occurrences; n_i negative occurrences (numbers with $n + m$ positions)

– first m digits of p_i : p_{ij} how often i -th atom occurs positively in j -th clause

– first m digits of n_i : n_{ij} how often i -th atom occurs negatively in j -th clause

– last n digits of p_i, n_i : p_{ij}, n_{ij} which atom is referred by p_i

p_i, n_i contain 1 at position $m + i$ and 0 otherwise.

Example

Let the set Prop of propositional variables consist of $\{x_1, x_2, x_3, x_4, x_5\}$.

$$F : (x_1 \vee \neg x_2 \vee x_4) \wedge (x_2 \vee x_2 \vee \neg x_5) \wedge (\neg x_3 \vee \neg x_1 \vee x_4)$$

$$p_1 = 100\ 10000$$

$$n_1 = 001\ 10000$$

$$p_2 = 020\ 01000$$

$$n_2 = 100\ 01000$$

$$p_3 = 000\ 00100$$

$$n_3 = 001\ 00100$$

$$p_4 = 101\ 00010$$

$$n_4 = 000\ 00010$$

$$p_5 = 000\ 00001$$

$$n_5 = 010\ 00001$$

Satisfying assignment: $\mathcal{A}(x_1)=\mathcal{A}(x_2)=\mathcal{A}(x_5)=1$ and $\mathcal{A}(x_3)=\mathcal{A}(x_4)=0$.

$$p_1 + p_2 + p_5 + n_3 + n_4 = \underbrace{121}_{\substack{\text{all digits } \leq 3 \\ \text{because 3 lit./clause}}} \quad \underbrace{11111}_{\substack{\text{all 1} \\ \text{all atoms considered}}}$$

Examples of NP-complete problems

Proof: (ctd.) If we have a satisfying assignment \mathcal{A} , we take for every propositional variable x_i mapped to 0 the number n_i and for every propositional variable x_i mapped to 1 the number p_i .

The sum of these numbers is $b_1 \dots b_m \underbrace{1 \dots 1}_{n \text{ times}}$ with $b_i \leq 3$,

so $b_1 \dots b_m \underbrace{1 \dots 1}_n < \underbrace{4 \dots 4}_m \underbrace{1 \dots 1}_n$

Let $b := \underbrace{4 \dots 4}_m \underbrace{1 \dots 1}_n$. We choose $\{a_1, \dots, a_k\} = \{p_1, \dots, p_n\} \cup \{n_1, \dots, n_n\} \cup C$.

The role of the numbers in $C = \{c_1, \dots, c_m, d_1, \dots, d_m\}$ is to make the sum of the a_i s equal to b : $c_{ij} = 1$ iff $i = j$; $d_{ij} = 2$ iff $i = j$ (they are zero otherwise).

$f(F) \in \text{Rucksack}$ iff a subset I of $\{a_1, \dots, a_k\}$ adds up to b

iff a subset I of $\{p_1, \dots, p_n\} \cup \{n_1, \dots, n_n\}$ adds up to $b_1 \dots b_m 1 \dots 1$

iff for a subset I of $\{p_1, \dots, p_n\} \cup \{n_1, \dots, n_n\}$ there exists an assignment

\mathcal{A} with $\mathcal{A}(P_i) = 1$ (resp. 0) iff p_i (resp. n_i) occurs in I iff **F satisfiable**

Summary

Examples of NP-complete problems:

1. Is a logical formula satisfiable? (SAT)
2. Does a graph contain a clique of size k ?
3. Rucksack problem
4. Can a graph be colored with three colors?
5. Is a (un)directed graph hamiltonian?
6. Multiprocessor scheduling
